

Streamlining High-Volume EDI and Real-Time Eligibility Checks for Avesis

Avesis, a leading benefits administrator, struggled with slow, manual processing of large, inconsistent EDI files and the inability to perform real-time eligibility checks across multiple systems. Using the Vorro VIIA Platform, they implemented an automated EDI pipeline that standardized, validated, and routed all partner data with full visibility and exception handling. VIIA also enabled millisecond-speed eligibility verification through a high-performance API that orchestrates internal system queries instantly.

About the Client

Avēsis is a leading administrator of vision, dental, and hearing insurance benefits for commercial and government-sponsored plans.

Vorro Solution

VIIA Platform – Intelligent
Data Control & Automation

Industry

Insurance / Benefits Administration

The Challenge

As a leading administrator of specialized health benefits, Avesis manages millions of member enrollment and claims transactions flowing through a complex ecosystem of health plan partners and providers. This data exchange relies heavily on X12 EDI (Electronic Data Interchange) files.

Avesis faced two critical, high-volume operational pain points:

1. **EDI Ingestion and Transformation:** Large batch files (834, 835, 837 transactions) arrived from various partners with disparate formats and specific routing rules. Manual intervention was frequently required to standardize, validate, and route these files into the core policy and claims processing systems, leading to delays and increased risk of error.
2. **Real-Time Eligibility Checks:** To ensure accurate claims processing and member services, Avesis needed the capability to perform instant, high-speed eligibility checks. This process required querying multiple internal systems to confirm benefit coverage status, but the existing integration methods were too slow and costly to scale for real-time demands.

The result was a growing operational drag: slow member enrollment processing, increased burden on IT staff, and delayed confirmation of covered services for providers.

The Solution

Avesis leveraged the Vorro VIIA Platform to introduce an automated, resilient, and scalable data pipeline for their most critical operations. The solution focused on two key areas:

1. Automated EDI Processing Pipeline

The Vorro VIIA Platform was implemented to serve as an intelligent, central clearinghouse for all inbound EDI files.

- **Universal EDI Translation:** VIIA's pre-built EDI capabilities standardized data formats automatically, eliminating the need for custom coding for each partner's variance.
- **Intelligent Routing and Validation:** Data received via partner SFTP's or APIs was automatically ingested, validated for compliance and routed directly to the appropriate backend systems.
- **Continuous Monitoring:** Vorro's system provided end-to-end visibility and an auditable log for every EDI transaction, drastically simplifying troubleshooting and compliance reporting.

2. Real-Time Eligibility & Service Verification

To ensure a smooth provider experience, VIIA enabled rapid, on-demand eligibility checks. API Orchestration: Vorro built a lightweight, high-performance API that acts as a single point of entry for eligibility requests.

- **Instant System Query:** This API instantly orchestrates queries across the necessary internal policy and membership databases (e.g., checking enrollment status, benefit limits, and coverage dates).
- **Millisecond Response:** The result is a millisecond-level response confirming whether the requested procedure or service is covered, giving providers the immediate answers needed to deliver care.

The Results

By deploying the Vorro VIIA Platform, Avesis transformed its complex data exchange operations from a cost center into an engine for efficiency and customer satisfaction.

Key Performance Indicator	Before Vorro	After Vorro	Impact
Time to Process Batch EDI	Hours (with manual checks)	Minutes (fully automated)	90% reduction in manual processing time
Eligibility Check Speed	Slow, non-scalable queries	Real-time (sub-second API response)	Enabled new real-time partner services
IT Development Effort	Custom code per partner interface	Zero-code configuration	75% reduction in integration maintenance cost
Data Quality Errors (EDI)	Manual reconciliation required	Near-zero due to automated validation	Improved regulatory compliance

"The ability of the Vorro VIIA Platform to manage our high-volume EDI transactions and provide instant eligibility verification has fundamentally changed how we interact with our partners. It's not just about integration; it's about providing superior, reliable service at scale."

— VP, Operations, Avesis
